

my settings:

light wind:

launch: 0°flap elevator slightly down(start neutral and trim down while throwing)

preset switch: 1mm up elevator

cruise: 2mm down ailerons

thermal 4-6mm down (cg at 64=6mm, cg at 68=4mm)

hard wind :

preset : less up(trim according wind speed to get desired climb angle)

launch : the same

cruise : 0.5mm down ailerons

thermal : not used, (you can try 2mm down ailerons)

in windy conditions i try to fly fast enough and don't add much camber.

CG at 250-300gram @61mm

CG at 300-350gram @64mm

CG at 350-400gram @65mm

I use snapflap in both ways (ailerons move 2mm up when elevator is full down, they move 2mm down when elevator full up)

I use all available travel , no expo , no differential.

I suggest to find you own optimum , this is just how I fly it !
